

Kim — this can help for the protein

I was researching. This is the good information, in one short place. You do not have to do more today.

Fat is the main food. Protein is a side, not a big plate of meat. You're on the right track with bone broth.

IF HE CAN EAT

- Eggs, fish, or a little clean meat — not a huge portion
- Always pair it with fat: olive oil, avocado, butter, or ghee

IF EATING IS HARD

- Bone broth is a good protein. Add butter if he tolerates it.
- A shake only if he cannot get enough food — unsweetened pea or rice, no sugar. Brands can be checked later.

SKIP

- Sugar, soda, juice, bread, pasta, rice
- Turning this into a carnivore / big-meat diet

ONE CLARIFICATION

- We do not cut protein to “turn off” something in the body. The body makes that on its own.
- We give enough protein to protect muscle, and use fat for most of the calories.
- If he is losing weight or muscle, we do not underfeed him to chase a number.

YOU DO NOT HAVE TO FIGURE OUT THE AMOUNTS

Dr. Max can fill in the gaps — how much protein and how much food, for Greg.

Keep bone broth going. Add fat when he can take it. That's the whole note.
